

FLAG JUSTIFICATION ASSESSMENT

Likely false positive

Provider correction: not confirmed.

High confidence within the reviewed task

Low

Moderate

High

Assistant-authored assessment · not a probability.

ANTHROPIC / CLAUDE CODE

A continuity feature.
A safeguard-driven model switch.

The work concerned continuing tasks when a runtime cannot start or a provider is unavailable. After local source inspection, Claude Code recorded a cyber-related safeguard refusal and switched models.

Client-reported event

Selected evidence

Redacted public edition

Selected model · client label	Fallback model · client label	Observed sequence
Fable 5.1	Opus 4.8	Source read → notice: ~7 sec

What supports the assessment?

The retained plan describes releasing a worktree when a session ends, recording why a runtime cannot start, reassigning the task, and continuing from saved notes on the existing branch. The reviewed commands inspect local source code.

Supporting evidence

- The user request explicitly asks for task continuity across models and provider outages.
- The implementation plan concerns runtime availability and saved task state.
- The final command reads part of a local Rust file. No exploit execution, credential collection or network targeting appeared in the reviewed sequence.
- The plan and source-inspection call were found on the message chain leading to the refusal notice.

What remains unknown

- The complete provider input and original refusal response were not retained here.
- The client reported a retracted assistant message that is missing from the retained log.
- The precise classifier trigger is unknown. Timing does not establish that the source-read command caused it.
- The full authorization behavior of the code was not audited; legitimate intent does not validate every possible implementation.

Public evidence summary

The summaries below are paraphrases of retained records. They are not verbatim evidence excerpts. Private source identifiers and internal code are withheld.

E1 The requested feature

Allow another capable model to continue a task using shared notes when a provider is unavailable. The owner explains that an unresolved issue motivated the request to remove reliance on one model.

Basis: the user message explicitly linked by the refusal notice, plus the owner's subsequent explanation of the motivation.

E2 The implementation plan

Dispatch the task through the scheduler. Release the worktree lease when the session ends. If the assigned runtime cannot start because of a missing binary, expired login or unavailable provider, record the reason and return the task for reassignment. Resume using its notes and existing branch.

Basis: retained assistant plan, verified on the refusal's message ancestry.

E3 The source inspection

```
sed -n 150,200p [local Rust source file]
```

The file path is replaced with a descriptive placeholder. The command reads lines 150–200; it does not modify or execute that file. Its recorded result preceded the safeguard notice.

E4 The intervention and fallback

A typed client event records a safeguard refusal, category cyber, and a switch from the Fable 5.1 label to the Opus 4.8 label. A subsequent assistant response uses the fallback model.

Basis: the native client notice and its descendant response. The original provider refusal payload is missing.

Sequence reconstructed from client records

Times are rounded offsets from the linked user request. Intermediate model calls and tool results occurred between these selected points.

ELAPSED	RECORDED ACTIVITY
00:00	User requests task continuation across models.
+17 sec	Assistant describes the implementation plan.
+45 sec	Final local source-read command is recorded; its result follows.
+52 sec	Client records safeguard refusal and model fallback.
+94 sec	Subsequent assistant response uses the fallback model.

Impact and review request

The established impact is the loss of the selected model after a client-reported safeguard intervention. This report does not establish worse answer quality, extra cost, a subscription-limit change or provider intent. The fallback continuing the task does not independently prove a false positive.

Question for Anthropic

Does the full retained provider-side request justify this cyber flag? Please review the task-continuity context and explain the safeguard intervention and model switch. Private request identifiers can be supplied separately for that investigation.

No feedback or complaint has been submitted as part of this report preparation.

About this public edition

This is an edited and redacted version of the private incident report, prepared for a blog post. Session, event and request identifiers, exact clock times, workspace and infrastructure details, source-code excerpts and private evidence hashes have been removed. Public evidence labels apply only within this edition.

The retained private report contains source-linked excerpts and review history. This public edition cannot independently reconstruct the full incident. The original source records were not changed to produce it.

Signature status: unsigned. This public edition carries no cryptographic signature or provider confirmation.
